This is about joint work in progress with Shuanhong Wang from Southeast University Nanjing (China).

Recall the definition of a multiplier Hopf algebra.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のので

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

 $T_1(a \otimes b) = \Delta(a)(1 \otimes b)$  and  $T_2(a \otimes b) = (a \otimes 1)\Delta(b)$ 

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

are bijective maps from  $A \otimes A$  to  $A \otimes A$ .

 $T_1(a \otimes b) = \Delta(a)(1 \otimes b)$  and  $T_2(a \otimes b) = (a \otimes 1)\Delta(b)$ 

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

are bijective maps from  $A \otimes A$  to  $A \otimes A$ .

Then  $(A, \Delta)$  is a multiplier Hopf algebra.

 $I_1(a \otimes b) = \Delta(a)(1 \otimes b)$  and  $I_2(a \otimes b) = (a \otimes 1)\Delta(a \otimes b)$ 

are bijective maps from  $A \otimes A$  to  $A \otimes A$ .

Then  $(A, \Delta)$  is a multiplier Hopf algebra.

For a weak multiplier Hopf algebra, the canonical maps are no longer assumed to be bijective.

For  $f \in K(G)$ , define  $\Delta(f)(p,q) = f(pq)$  if  $p, q \in G$  and if pq is defined; otherwise we set  $\Delta(f)(p,q) = 0$ . Then  $(A, \Delta)$  is a regular weak multiplier Hopf algebra. The idempotent E is given by the function that is 1 on pairs (p,q) of elements so that pq is defined and 0 on other pairs. The antipode is given by  $S(f)(p) = f(p^{-1})$ .

Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

#### Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

• A is an idempotent algebra with a non-degenerate product.

#### Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

- A is an idempotent algebra with a non-degenerate product.
- $\Delta : A \to M(A \otimes A)$  is a full coproduct with a counit.

#### Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

- A is an idempotent algebra with a non-degenerate product.
- $\Delta : A \to M(A \otimes A)$  is a full coproduct with a counit.
- There is an idempotent multiplier  $E \in M(A \otimes A)$  so that

 $\Delta(A)(1 \otimes A) = E(A \otimes A)$  and  $(A \otimes 1)\Delta(A) = (A \otimes A)E$ 

#### Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

- A is an idempotent algebra with a non-degenerate product.
- $\Delta : A \to M(A \otimes A)$  is a full coproduct with a counit.
- There is an idempotent multiplier  $E \in M(A \otimes A)$  so that

 $\Delta(A)(1\otimes A) = E(A\otimes A)$  and  $(A\otimes 1)\Delta(A) = (A\otimes A)E$ 

and

 $(\iota \otimes \Delta)(E) = (E \otimes 1)(1 \otimes E) = (1 \otimes E)(E \otimes 1).$ 

#### Definition

A pair  $(A, \Delta)$  will be a weak multiplier Hopf algebra if:

- A is an idempotent algebra with a non-degenerate product.
- $\Delta : A \to M(A \otimes A)$  is a full coproduct with a counit.
- There is an idempotent multiplier  $E \in M(A \otimes A)$  so that

 $\Delta(A)(1 \otimes A) = E(A \otimes A)$  and  $(A \otimes 1)\Delta(A) = (A \otimes A)E$ 

and

 $(\iota \otimes \Delta)(E) = (E \otimes 1)(1 \otimes E) = (1 \otimes E)(E \otimes 1).$ 

 The kernels of the canonical maps are given by the ranges of the idempotents 1 – F<sub>1</sub> and 1 – F<sub>2</sub> respectively where F<sub>1</sub> and F<sub>2</sub> are obtained as follows.
Let  $(A, \Delta)$  and *E* in  $M(A \otimes A)$  be as before.

Let  $(A, \Delta)$  and *E* in  $M(A \otimes A)$  be as before.

### Proposition

There exists a right multiplier  $F_1$  of  $A \otimes A^{op}$  and a left multiplier  $F_2$  of  $A^{op} \otimes A$ , uniquely determined by

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

 $E_{13}(F_1 \otimes 1) = E_{13}(1 \otimes E)$  and  $(1 \otimes F_2)E_{13} = (E \otimes 1)E_{13}$ .

Let  $(A, \Delta)$  and *E* in  $M(A \otimes A)$  be as before.

#### Proposition

There exists a right multiplier  $F_1$  of  $A \otimes A^{op}$  and a left multiplier  $F_2$  of  $A^{op} \otimes A$ , uniquely determined by

 $E_{13}(F_1 \otimes 1) = E_{13}(1 \otimes E)$  and  $(1 \otimes F_2)E_{13} = (E \otimes 1)E_{13}$ .

#### Remark

 These idempotents F<sub>1</sub> and F<sub>2</sub> define idempotent maps G<sub>1</sub> and G<sub>2</sub> from A ⊗ A to itself by

 $\begin{aligned} G_1(a\otimes b) &= (a\otimes 1)F_1(1\otimes b)\\ G_2(a\otimes b) &= (a\otimes 1)F_2(1\otimes b). \end{aligned}$ 

Let  $(A, \Delta)$  and *E* in  $M(A \otimes A)$  be as before.

### Proposition

There exists a right multiplier  $F_1$  of  $A \otimes A^{op}$  and a left multiplier  $F_2$  of  $A^{op} \otimes A$ , uniquely determined by

 $E_{13}(F_1 \otimes 1) = E_{13}(1 \otimes E)$  and  $(1 \otimes F_2)E_{13} = (E \otimes 1)E_{13}$ .

#### Remark

 These idempotents F<sub>1</sub> and F<sub>2</sub> define idempotent maps G<sub>1</sub> and G<sub>2</sub> from A 
A to itself by

> $G_1(a \otimes b) = (a \otimes 1)F_1(1 \otimes b)$  $G_2(a \otimes b) = (a \otimes 1)F_2(1 \otimes b).$

• We have  $T_1 \circ (1 - G_1) = 0$  and  $T_2 \circ (1 - G_2) = 0$ .

### Existence of the antipode

#### Definition

A generalized inverse  $R_1$  of  $T_1$  is a linear map from  $A \otimes A$  to itself so that  $T_1R_1T_1 = T_1$  and  $R_1T_1R_1 = R_1$ . Similarly for  $T_2$ .

### Existence of the antipode

#### Definition

A generalized inverse  $R_1$  of  $T_1$  is a linear map from  $A \otimes A$  to itself so that  $T_1R_1T_1 = T_1$  and  $R_1T_1R_1 = R_1$ . Similarly for  $T_2$ .

These generalized inverses are completely determined by a choice of projections on the ranges and on the kernels.

・ コット ( 雪 ) ・ ( 目 ) ・ ( 目 )

## Existence of the antipode

#### Definition

A generalized inverse  $R_1$  of  $T_1$  is a linear map from  $A \otimes A$  to itself so that  $T_1R_1T_1 = T_1$  and  $R_1T_1R_1 = R_1$ . Similarly for  $T_2$ .

These generalized inverses are completely determined by a choice of projections on the ranges and on the kernels.

#### Proposition

There exists a unique linear map S from A to M(A), such that The maps  $R_1$  and  $R_2$  given by

 $R_1(a \otimes b) = \sum_{(a)} a_{(1)} \otimes S(a_{(2)})b$ 

 $R_2(a \otimes b) = \sum_{(b)} aS(b_{(1)}) \otimes b_{(2)}$ 

are generalized inverses of the canonical maps  $T_1$  and  $T_2$ .

### Remark

First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively.

#### Remark

 First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively. The fact that S<sub>1</sub> and S<sub>2</sub> actually coincide is a consequence of the formulas giving the idempotents F<sub>1</sub> and F<sub>2</sub> in terms of E.

#### Remark

 First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively. The fact that S<sub>1</sub> and S<sub>2</sub> actually coincide is a consequence of the formulas giving the idempotents F<sub>1</sub> and F<sub>2</sub> in terms of E. This is a remarkable fact.

#### Remark

 First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively. The fact that S<sub>1</sub> and S<sub>2</sub> actually coincide is a consequence of the formulas giving the idempotents F<sub>1</sub> and F<sub>2</sub> in terms of E. This is a remarkable fact.

We have

 $\sum_{(a)} a_{(1)} S(a_{(2)}) a_{(3)} = a$  $\sum_{(a)} S(a_{(1)}) a_{(2)} S(a_{(3)}) = S(a).$ 

#### Remark

 First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively. The fact that S<sub>1</sub> and S<sub>2</sub> actually coincide is a consequence of the formulas giving the idempotents F<sub>1</sub> and F<sub>2</sub> in terms of E. This is a remarkable fact.

• We have

 $\sum_{(a)} a_{(1)} S(a_{(2)}) a_{(3)} = a$  $\sum_{(a)} S(a_{(1)}) a_{(2)} S(a_{(3)}) = S(a).$ 

 If the map S is bijective from A to itself, we call the weak multiplier Hopf algebra regular.

#### Remark

 First, we obtain maps S<sub>1</sub> and S<sub>2</sub> giving R<sub>1</sub> and R<sub>2</sub> respectively. The fact that S<sub>1</sub> and S<sub>2</sub> actually coincide is a consequence of the formulas giving the idempotents F<sub>1</sub> and F<sub>2</sub> in terms of E. This is a remarkable fact.

• We have

 $\sum_{(a)} a_{(1)} S(a_{(2)}) a_{(3)} = a$  $\sum_{(a)} S(a_{(1)}) a_{(2)} S(a_{(3)}) = S(a).$ 

 If the map S is bijective from A to itself, we call the weak multiplier Hopf algebra regular. This happens, as in the case of Hopf algebras, precisely if flipping the coproduct on A (or the multiplication in A) still yields a weak multiplier Hopf algebra.

### The source and target maps

Recall that in a groupoid, the product pq of two elements p, q is defined if the source s(p) is equal to the target t(p).

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

### The source and target maps

Recall that in a groupoid, the product pq of two elements p, q is defined if the source s(p) is equal to the target t(p). They are thought of as elements in *G* and we have the formulas

$$s(p) = p^{-1}p$$
 and  $t(p) = pp^{-1}$ 

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQで

for all  $p \in G$ .

### The source and target maps

# The source and target algebras

The source and target maps, map into the source and target algebras  $A_s$  and  $A_t$ . They are defined as follows.

### Definition

Let *E* be the canonical idempotent of the weak multiplier Hopf algebra  $(A, \Delta)$ .

The source and target maps, map into the source and target algebras  $A_s$  and  $A_t$ . They are defined as follows.

#### Definition

Let *E* be the canonical idempotent of the weak multiplier Hopf algebra  $(A, \Delta)$ . Then we denote

 $A_{s} = \{y \in M(A) \mid \Delta(y) = E(1 \otimes y)\}.$ 

 $A_t = \{ x \in M(A) \mid \Delta(x) = (x \otimes 1)E \}.$ 

The source and target maps, map into the source and target algebras  $A_s$  and  $A_t$ . They are defined as follows.

### Definition

Let *E* be the canonical idempotent of the weak multiplier Hopf algebra  $(A, \Delta)$ . Then we denote

$$A_s = \{y \in M(A) \mid \Delta(y) = E(1 \otimes y)\}.$$

 $A_t = \{x \in M(A) \mid \Delta(x) = (x \otimes 1)E\}.$ 

#### Remark

The spaces ε<sub>s</sub>(A) and ε<sub>t</sub>(A) are subalgebras of A<sub>s</sub> and A<sub>t</sub> respectively.

The source and target maps, map into the source and target algebras  $A_s$  and  $A_t$ . They are defined as follows.

### Definition

Let *E* be the canonical idempotent of the weak multiplier Hopf algebra  $(A, \Delta)$ . Then we denote

 $A_{s} = \{y \in M(A) \mid \Delta(y) = E(1 \otimes y)\}.$ 

 $A_t = \{x \in M(A) \mid \Delta(x) = (x \otimes 1)E\}.$ 

#### Remark

The spaces ε<sub>s</sub>(A) and ε<sub>t</sub>(A) are subalgebras of A<sub>s</sub> and A<sub>t</sub> respectively. In fact, we can show that A<sub>s</sub> and A<sub>t</sub> are the multiplier algebras of ε<sub>s</sub>(A) and ε<sub>t</sub>(A).

The source and target maps, map into the source and target algebras  $A_s$  and  $A_t$ . They are defined as follows.

### Definition

Let *E* be the canonical idempotent of the weak multiplier Hopf algebra  $(A, \Delta)$ . Then we denote

 $A_{s} = \{y \in M(A) \mid \Delta(y) = E(1 \otimes y)\}.$ 

 $A_t = \{x \in M(A) \mid \Delta(x) = (x \otimes 1)E\}.$ 

#### Remark

- The spaces ε<sub>s</sub>(A) and ε<sub>t</sub>(A) are subalgebras of A<sub>s</sub> and A<sub>t</sub> respectively. In fact, we can show that A<sub>s</sub> and A<sub>t</sub> are the multiplier algebras of ε<sub>s</sub>(A) and ε<sub>t</sub>(A).
- The algebras  $A_s$  and  $A_t$  (or rather  $\varepsilon_s(A)$  and  $\varepsilon_t(A)$ ) are the 'left' and the 'right' leg of E and  $E \in M(\varepsilon_s(A) \otimes \varepsilon_t(A))$ .

### Integrals on weak multiplier Hopf algebras

### Definition

Let  $(A, \Delta)$  be a (regular) weak multiplier Hopf algebra with source and target algebras  $A_s$  and  $A_t$ . A non-zero linear functional  $\varphi$  on A is called a left integral if  $(\iota \otimes \varphi)\Delta(a) \in A_t$  for all  $a \in A$ . Similarly, a non-zero linear functional  $\psi$  on A is called a right integral if  $(\psi \otimes \iota)\Delta(a) \in A_s$  for all  $a \in A$ .

 If (A, Δ) is a multiplier Hopf algebra, the algebras A<sub>s</sub> and A<sub>t</sub> are scalar multiples of the identity, and we get the usual definitions.

### Integrals on weak multiplier Hopf algebras

### Definition

Let  $(A, \Delta)$  be a (regular) weak multiplier Hopf algebra with source and target algebras  $A_s$  and  $A_t$ . A non-zero linear functional  $\varphi$  on A is called a left integral if  $(\iota \otimes \varphi)\Delta(a) \in A_t$  for all  $a \in A$ . Similarly, a non-zero linear functional  $\psi$  on A is called a right integral if  $(\psi \otimes \iota)\Delta(a) \in A_s$  for all  $a \in A$ .

- If (A, Δ) is a multiplier Hopf algebra, the algebras A<sub>s</sub> and A<sub>t</sub> are scalar multiples of the identity, and we get the usual definitions.
- As the antipode S flips the coproduct and maps A<sub>t</sub> to A<sub>s</sub>, it will map left integrals to right integrals (and vice versa).

# More properties of integrals

Proposition

Let  $\varphi$  be a non-zero linear functional on A. For  $a, b \in A$ , let

 $c = (\iota \otimes \varphi)(\Delta(a)(1 \otimes b))$  and  $d = (\iota \otimes \varphi)((1 \otimes a)\Delta(b)).$ 

These elements belong to A. Then  $\varphi$  is a left integral if and only if we have d = S(c) for all a and b. There is a similar result for right integrals.

# More properties of integrals

Proposition

Let  $\varphi$  be a non-zero linear functional on A. For  $a, b \in A$ , let

 $c = (\iota \otimes \varphi)(\Delta(a)(1 \otimes b))$  and  $d = (\iota \otimes \varphi)((1 \otimes a)\Delta(b)).$ 

These elements belong to A. Then  $\varphi$  is a left integral if and only if we have d = S(c) for all a and b. There is a similar result for right integrals.

#### Remark

 This result looks completely the same as for multiplier Hopf algebras (and algebraic quantum hypergroups).

# More properties of integrals

Proposition

Let  $\varphi$  be a non-zero linear functional on A. For  $a, b \in A$ , let

 $c = (\iota \otimes \varphi)(\Delta(a)(1 \otimes b))$  and  $d = (\iota \otimes \varphi)((1 \otimes a)\Delta(b)).$ 

These elements belong to A. Then  $\varphi$  is a left integral if and only if we have d = S(c) for all a and b. There is a similar result for right integrals.

#### Remark

- This result looks completely the same as for multiplier Hopf algebras (and algebraic quantum hypergroups).
- It is the main reason why many properties for multiplier Hopf algebras with integrals remain true for weak multiplier Hopf algebras.
