

# Tempered fundamental group of curves

Emmanuel LEPAGE  
IMJ-PRG, Paris

The tempered fundamental group of a Berkovich analytic space over a nonarchimedean field classifies analytic étale maps which become topological covers for Berkovich topology after pullback by a surjective finite étale cover. We will discuss what can be recovered of a smooth algebraic curve over an algebraically closed extension of the  $p$ -adic field from its tempered fundamental group.
